PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

**Office Action Summary**

Application No.

10/627,544

Applicant(s)

JONES ET AL.

Examiner

John B. Strege

Art Unit

2624

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 16 April 2007.  
2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.  
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-15 is/are pending in the application.  
4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.  
5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.  
6) ☒ Claim(s) 1-15 is/are rejected.  
7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.  
8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.  
10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892)  
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)  
3) ☐ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.  
4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.  
5) ☐ Notice of Informal Patent Application  
6) ☐ Other: \_\_\_\_\_.

***Response to Amendment***

1. The amendment received 4/16/07 has been entered in full.

***Response to Arguments***

2. Applicant's arguments filed 4/16/07 have been fully considered but they are not persuasive. Specifically the Applicant points out that Kermode describes a very different device and method and fails to teach or suggest Applicants' claimed method and device, however the Applicant does not distinguish in what way that Kermode fails to read on the claimed invention. The Examiner has given the broadest interpretation to the claim language and as such Kermode reads on the claimed invention as pointed out in the previous rejection. Thus the rejection is maintained.

***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-4 and 11 are rejected under 35 U.S.C. 102(b) as being anticipated by Kermode (US Patent No 3,841,734).

Regarding claim 1, Kermode discloses a system and method for contrast enhancement comprising viewing a scene with a viewing device (eyes, video camera, or other device), adjusting two circular variable interference filters (CVF) such that each CVF permits a specific wavelength of light in the range of 400nm to 1200nm to pass to

Art Unit: 2624

the viewing device, as disclosed at column 2 line 60 - column 3 line 16, which reads on "viewing an area with a viewing device, while selectively and varyingly changing a sensitivity of the viewing device to certain wavelengths of light (electromagnetic radiation) lying in any one of the ultraviolet (UV) range, the visible range, the near infrared range or the far infrared range", and combining the light transmitted through the two filters and detected by the viewing device, wherein the two filters are adjusted to wavelengths that alter the appearance of a target object relative to the background of the scene, in order to detect the object, as disclosed at column 3 line 19 - column 4 line 60, which reads on "determining the presence of an object when a visual difference between the object and background is discerned when the sensitivity of the viewing device is changed to a certain mixture of wavelengths of light".

Regarding claim 2, Kermode discloses everything as applied above (see claim 1).

Kermode further discloses where there is no discernable difference between the target object and the background of the scene if the two filters are adjusted to pass different wavelengths, as disclosed at column 8 lines 1-7, which reads on "wherein said determining includes determining the presence of an object when a visual difference is observed between the object and the background and when no discernable visual difference is observed when the sensitivity of the viewing device is changed to at least another mixture of wavelengths of light".

Regarding claim 3, Kermode discloses everything as applied above (see claim 1). As discussed above, Kermode discloses viewing a scene with a viewing device (eyes, video camera, or other device), adjusting two circular variable interference filters (CVF)

Art Unit: 2624

such that each CVF permits a specific wavelength of light in the range of 400nm to 1200nm to pass to the viewing device and combining the light transmitted through the two filters and detected by the viewing device, wherein the two filters are adjusted to wavelengths that alter the appearance of a target object relative to the background of the scene, in order to detect the object, which reads on "wherein said viewing an area includes viewing the area with the viewing device in the visual light spectrum and while selectively varyingly changing the sensitivity of the viewing device to certain wavelengths of light lying in one of the UV range, the near IR range or the far IR range; and determining the presence of an object when a visual difference between the object and background is discerned when the sensitivity of the viewing device is changed to a certain mixture of wavelengths of light in the visual range and the one of the UV range, the near IR range or the far IR range".

Regarding claim 4, Kermode discloses everything as applied above (see claim 3). As discussed above, Kermode discloses adjusting the two filters in order to detect a target object and further discloses where there is no discernable difference between the target object and the background of the scene if the two filters are adjusted to pass different wavelengths, wherein if there is no discernable difference between a target object and the background, the filters are adjusted in order to detect the object, which reads on "wherein said determining includes determining the presence of an object when a visual difference is observed between the object and the background and when no discernable visual difference is observed when the sensitivity of the viewing device is changed to at least another mixture of wavelengths of light".

Art Unit: 2624

Regarding claim 11, it is interpreted and thus rejected for the same reasons as applied above in the rejection of claim 1.

***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 5-10, and 12-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kermode in view of Miller (US Patent No 5,940,183).

Regarding claim 5, Kermode discloses everything as applied above (see claim 3). However, Kermode fails to specifically disclose wherein the filters comprise a plurality of bandpasses wherein each bandpass has a predetermined bandwidth. However, the examiner maintains that it was well known in the art to provide for wherein a filter comprises a plurality of bandpasses wherein each bandpass has a predetermined bandwidth, as taught by Miller.

In the same field of endeavor, Miller discloses a filter wheel comprising a plurality of filter segments wherein each segment has a bandpass with a unique center wavelength, wherein each segment also has a predetermined bandwidth, as disclosed at column 3 lines 8 - column 4 line 36, which reads on "dividing at least a portion of the one of the UV range, the near IR range or the far IR range into one or more viewing bandpasses, each bandpass having a predetermined bandwidth".

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made, to modify Kermode, by providing for wherein a filter comprises a plurality of bandpasses wherein each bandpass has a predetermined bandwidth, as taught by Miller, for the purpose of capturing a range of wavelengths, by using bandpasses, instead of single wavelengths, thereby improving the target object detection.

Regarding claim 6, it is interpreted and thus rejected for the same reasons as applied above in the rejection of claims 2 and 5.

Regarding claim 7, Kermode and Miller disclose everything as applied above (see claims 5 and 6). As discussed above, Miller discloses a filter wheel comprising a plurality of filter segments wherein each segment has a bandpass with a unique center wavelength, which reads on "wherein said dividing includes dividing at least a portion of the one of the UV range, the near IR range or the far IR range into a plurality or more viewing bandpasses".

Regarding claim 8, it is interpreted and thus rejected for the same reasons as applied above in the rejection of claims 5 and 7.

Regarding claim 9, Kermode and Miller disclose everything as applied above (see claims 5 and 6). Miller further discloses where the bandpasses must remain narrow and have a unique center wavelength, wherein this would minimize contributions from other spectral ranges. In addition Kermode discloses where the bandpass is as narrow as a single wavelength, wherein this minimizes contributions from other spectral images, but is still wide enough to pass enough light to the viewing device to cause

Art Unit: 2624

differences in the display, which reads on "wherein said dividing includes setting the bandwidth so each viewing bandpass has a width that is narrow enough so as to minimize contributions from other areas of the spectral region that would tend to mask the visual difference between the object and the background and wide enough to pass enough light/energy so as to make a difference in a display of a viewing device".

Regarding claim 10, Kermode and Miller disclose everything as applied above (see claims 5 and 6). Miller further discloses where the bandwidths of the bandpasses for the plurality of filter segments are set such that the bandpasses partially overlap, as disclosed at column 4 lines 7-18, which reads on "wherein said dividing includes arranging the viewing bandpasses and setting the bandwidth of adjacent viewing bandpasses of the one or more viewing bandpasses such that the adjacent viewing bandpasses partially overlap".

Regarding claim 12, Kermode discloses everything as applied above (see claim 11). Kermode discloses as discussed above, viewing a scene with a viewing device (eyes, video camera, or other device), and adjusting two circular variable interference filters (CVF) such that each CVF permits a specific wavelength of light in the range of 400nm to 1200nm to pass to the viewing device, which reads on "a plurality of filters, the filters being configured and arranged so each view a different bandwidth of the one of the ultraviolet (UV) range, the visible range, the near infrared or the far infrared; and a mechanism for selectively positioned each filter at a light input end of the electro-optical viewing device".

Art Unit: 2624

Regarding claim 13, Kermode discloses everything as applied above (see claim 11). As applied above, it would be obvious to modify Kermode by Miller, wherein Kermode and Miller disclose a plurality of filter segments, each configured to view a different bandwidth, wherein the filter segments are rotated in front of the viewing device, which reads on "wherein the mechanism includes: a filter comprised of a plurality of filter segments, the filter segments being configured and arranged so each view a different bandwidth of the one of the ultraviolet (UV) range, the visible range, the near infrared or the far infrared; and a mechanism for one of selectively rotating, shifting or tilting the filter so as to successively position each filter segment at a light input end of the electro-optical viewing device".

Regarding claim 14, Kermode and Miller disclose everything as applied above (see claims 11-13). Kermode discloses as discussed above, wherein the viewing device is a video camera, and further discloses wherein output from the video camera is fed to a television monitor, as disclosed at column 4 lines 37-44, which reads on "wherein the electro-optical viewing device is one of a monochromatic image viewing device or a color image viewing device", wherein it is inherent that the video camera and television monitor are either color or monochromatic (black and white).

6. Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kermode in view of Miller further in view of Korniski et al. (US Patent No 6,646,799), hereinafter referenced as Korniski.

Art Unit: 2624

Regarding claim 15, Kermode and Miller disclose everything as applied above (see claims 11-13). However, they fail to specifically disclose where the amount of light in each of the viewing bandpasses is successively and separately added into the image forming sensitivity of the color image viewing device. However, the examiner maintains that it was well known in the art to provide for successively and separately adding multiple viewing bandpasses into the image forming sensitivity of a color image viewing device, as taught by Korniski.

In the same field of endeavor, Korniski discloses a system for combining multiple energy bands to improve scene viewing comprising a system for combining multiple energy bands to improve scene viewing comprising successively and separately adding multiple viewing bandpasses into the image forming sensitivity of a color image viewing device, as disclosed at column 5 lines 4-45, which reads on "wherein the electro-optical viewing device is a color image viewing device and the an amount of light in each of the viewing bandpasses is successively and separately added into the image forming sensitivity of the color image viewing device".

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made, to modify Kermode and Miller, by providing for where the amount of light in each of the viewing bandpasses is successively and separately added into the image forming sensitivity of the color image viewing device, as taught by Korniski, for the purpose of allowing the user to view the scene under any combination of filters at a given point in time, i.e. only IR, only visible, or combination (column 5 lines 32-45).

***Conclusion***

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

***Contact Information***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to John B. Strege whose telephone number is (571) 272-7457. The examiner can normally be reached on Monday-Friday between the hours of 8-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Bhavesh Mehta can be reached on (571) 272-7453. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
